

Дондик Ярослав, БПИ191

В [данной папке](#) представлено выполнение четвертого домашнего задания по работе с параллельным программированием в C++.

Отчет лежит по этой ссылке - [HW4/readme.pdf](#)

Исходники лежат в [HW4/src/](#), а скриншоты в [HW4/img/](#)

Вариант 14. Условие

Определить множество индексов i , для которых $A[i]$ и $B[i]$ не имеют общих делителей (единицу в роли делителя не рассматривать).

Входные данные: массивы целых положительных чисел A и B , произвольной длины ≥ 1000 .

Количество потоков является входным параметром

Идея программы

- **Описание**

Для выполнения задания был выбран следующий метод построения многопоточных приложений: итеративный параллелизм (все потоки работают над одной задачей-циклом)

Примерный алгоритм работы:

1. С консоли вводится требуемое количество потоков
2. Создаются и заполняются два массива указанного размера (константа в начале исходного кода)
3. Запуск потоков, выполняющих свою часть цикла. Сохранение искомым индексов, вывод лог-данных в консоль
4. Вывод ответа и затраченное время на выполнение программы

Код программы

[Исходный код](#)

[Исполняемый файл](#)

Рассмотрим некоторые части кода, работу потоков и их основную функцию:

- Основная функция программы (main)

```
// Инициализация массивов с числами
A = vector<int>(arrSize);
B = vector<int>(arrSize);

// Заполнение массивов числами от 100 до 199
for (int i = 0; i < arrSize; ++i) {
    A[i] = rand() % 100 + 100;
    B[i] = rand() % 100 + 100;
}

// Сохраняем время начала работы
auto begin = std::chrono::steady_clock::now();

// Выполняем основную задачу параллельно
gcd_cycle(setIndexes);

// Останавливаем таймер
auto end = std::chrono::steady_clock::now();

// Затраченное время
auto elapsed_ms = std::chrono::duration_cast<std::chrono::milliseconds>(end - begin);

// Вывод массива индексов, у которых числа не имеют общих делителей
cout << "\nSet of indexes: \n";
for (auto k : setIndexes) {
    cout << k << " ";
}

cout << "\n\nElapsed time: " << elapsed_ms.count() << " ms\n";
```

- Функция поиска индексов взаимнопростых элементов

Здесь вызывается `omp parallel`, с указанным количеством потоков.

Далее, вызывается выражение `omp for`, за которым следует цикл, который будет выполняться параллельно.

```
void gcd_cycle(set<int>& setIndex) {
#pragma omp parallel num_threads(threadNumber)
{
    #pragma omp for
    for (int i = 0; i < A.size(); i += 1) {

        // Подсчет наибольшего общего делителя
        unsigned gcd_result = GCD(A[i], B[i]);

        // Если нет общих делителей, кроме 1:
        if (gcd_result == 1) {
            {
                // Блокировка вывода с других потоков
                #pragma omp critical(cout)
                {
                    cout << "Thread " << omp_get_thread_num() << " found pair of gcd == 1:" <<
                        " A[" << i << "] = " << A[i] << " and B[" << i << "] = " << B[i] << "\n";
                }
            }

            // Добавляем индекс в наше множество
            setIndex.insert(i);
        }
    }

    // Завершение потоков
#pragma omp critical(cout)
    {
        cout << "Thread " << omp_get_thread_num() << " finished\n";
    }
}
}
```

- Функция поиска наибольшего общего делителя двух чисел (основана на алгоритме Евклида)

```
/// <summary>
/// Вычисление наибольшего общего делителя
/// </summary>
/// <param name="u">Первое число</param>
/// <param name="v">Второе число</param>
/// <returns>Наибольший общий делитель переданных чисел</returns>
unsigned GCD(unsigned u, unsigned v) {
    while (v != 0) {
        unsigned r = u % v;
        u = v;
        v = r;
    }
    return u;
}
```

Тестирование программы

- Тест 1

Проверим программу на некорректном вводе:

 Консоль отладки Microsoft Visual Studio

```
Please, enter size of an array of integers (>= 1000): qwerty
Incorrect input. Please, enter your number again: -10
Incorrect input. Please, enter your number again: -1
Incorrect input. Please, enter your number again: 0
Incorrect input. Please, enter your number again: 999
Incorrect input. Please, enter your number again: 1000
Please, enter number of threads: qwerty
Incorrect input. Please, enter your number again: -1
Incorrect input. Please, enter your number again: 0
Incorrect input. Please, enter your number again: 5
Thread 0 found pair of gcd == 1: A[0] = 28769 and B[0] = 16547
Thread 0 found pair of gcd == 1: A[15] = 325 and B[15] = 30709
Thread 0 found pair of gcd == 1: A[20] = 1569 and B[20] = 12842
Thread 0 found pair of gcd == 1: A[25] = 24939 and B[25] = 5579
Thread 0 found pair of gcd == 1: A[30] = 619 and B[30] = 10263
Thread 1 found pair of gcd == 1: A[1] = 28269 and B[1] = 22799
Thread 1 found pair of gcd == 1: A[6] = 30737 and B[6] = 19198
```

После успешного ввода происходит вывод логов от каждого потока:

```
Thread 2 found pair of gcd == 1: A[322] = 4740 and B[322] = 16129
Thread 2 found pair of gcd == 1: A[327] = 31161 and B[327] = 4088
Thread 2 found pair of gcd == 1: A[357] = 26636 and B[357] = 31723
Thread 2 found pair of gcd == 1: A[367] = 24181 and B[367] = 30971
Thread 2 found pair of gcd == 1: A[377] = 7911 and B[377] = 31129
Thread 3 found pair of gcd == 1: A[8] = 16285 and B[8] = 9006
